## Abstracts

According to our (Global Info Research) latest study, the global 3D MEMS Probe Card market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

3D MEMS probe card is an advanced test tool based on Micro-Electro-Mechanical Systems (MEMS) technology, mainly used for testing semiconductor devices. 3D MEMS probe card is an important application of MEMS technology in the field of semiconductor testing. It combines the characteristics of high precision, miniaturization and high reliability, and is used to achieve high-precision contact and signal transmission between the chip under test.

3D MEMS probe card is mainly composed of probe pin, electronic component, wire and printed circuit board (PCB). The probe part is manufactured using MEMS technology and has the characteristics of high integration, miniaturization and customization. 3D MEMS probe card is mainly used for the interface between the chip under test and the tester in semiconductor wafer testing. During the wafer testing process, the chip under test is placed on the probe station, and the probe on the 3D MEMS probe card directly contacts the pad or bump on the chip, leading out the chip signal generated by the tester and applying it to the device under test. At the same time, it can also transmit the feedback signal from the device under test back to the tester, thus completing the entire test process.
