Abstracts

According to our (Global Info Research) latest study, the global 3D Printers for Aerospace and Aviation market size was valued at USD 895.2 million in 2022 and is forecast to a readjusted size of USD 1974.3 million by 2029 with a CAGR of 12.0% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

3D printing is a clear fit for many prototyping and end-use applications within the aerospace and aviation industry. Parts produced via additive manufacturing can be stronger and lighter than those made using traditional manufacturing.

Aerospace was a very early adopter of 3D printing and still continues to contribute heavily to its development. Companies in this industry began using 3D printing in 1989, and in 2015, aerospace accounted for 16% of additive's \$4.9B global revenue.

One of the areas where 3D printing has been most disruptive and valuable is the production of low-cost rapid tooling for injection molding, thermoforming and jigs and fixtures. Within aerospace, this allows for tooling to be quickly manufactured at a low cost and then used to produce low to medium runs of parts. This validation mitigates the risk when investing in high-cost tooling at the production stage and can also provide production components for quantities up to 5,000 to 10,000 parts.

Production volumes in the aerospace industry can reach more than 70,000 parts per year, so 3D printing has predominantly been used in the past as a prototyping solution rather than the manufacturing of end-use parts.

Today, improvements in the size of industrial printers, the speed they are able to print at and the materials that are available all make 3D printing a viable option for more medium-sized production runs, particularly for high-end interior build-outs.
