Abstracts

The global 3D Printers for Aerospace and Aviation market size is expected to reach \$ 1974.3 million by 2029, rising at a market growth of 12.0% CAGR during the forecast period (2023-2029).

3D printing is a clear fit for many prototyping and end-use applications within the aerospace and aviation industry. Parts produced via additive manufacturing can be stronger and lighter than those made using traditional manufacturing.

Aerospace was a very early adopter of 3D printing and still continues to contribute heavily to its development. Companies in this industry began using 3D printing in 1989, and in 2015, aerospace accounted for 16% of additive's \$4.9B global revenue.

One of the areas where 3D printing has been most disruptive and valuable is the production of low-cost rapid tooling for injection molding, thermoforming and jigs and fixtures. Within aerospace, this allows for tooling to be quickly manufactured at a low cost and then used to produce low to medium runs of parts. This validation mitigates the risk when investing in high-cost tooling at the production stage and can also provide production components for quantities up to 5,000 to 10,000 parts.

Production volumes in the aerospace industry can reach more than 70,000 parts per year, so 3D printing has predominantly been used in the past as a prototyping solution rather than the manufacturing of end-use parts.

Today, improvements in the size of industrial printers, the speed they are able to print at and the materials that are available all make 3D printing a viable option for more medium-sized production runs, particularly for high-end interior build-outs.

This report studies the global 3D Printers for Aerospace and Aviation production, demand, key manufacturers, and key regions.
