## Abstracts

According to our (Global Info Research) latest study, the global 3D Printing Electronics market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

With 3D printing electronics, it is possible to make various types of boards that can be programmed and connected to prototypes. A very wide range of inks can be utilized enabling a full range of printed electronics functionality: conductors, semiconductors, dielectrics, resistors and more. The process can be used to manufacture electronic components such as resistors, capacitors, antennas, sensors, and thin film transistors. Using the 3D printing process, it is also possible to rapidly 3D print fully functional electronic circuits that contain electrically-conductive metallic inks and insulating polymeric inks, which could be useful for medical devices, radio frequency shielding surfaces and novel structures for harvesting solar energy. Today, however, it's main applications include printing electronics for use in prototypes for upcoming products, prosthetics and more complexly shaped electronic products.
