According to our (Global Info Research) latest study, the global 3D Printing in Aerospace and Defence market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

3D printing, the colloquial name for Additive Manufacturing, is a manufacturing technique of creating a digital blueprint with the help of Computer Aided Design (CAD) or animation software to create a solid, physical object. It was even mentioned by President Obama in his 2013 State of the Union Address as a truly transformative technology having the potential to revolutionise the world. 3D printing allows the conversion of ideas from fiction to fact. It uses a layer-by-layer approach for creating prototypes, spare parts and final products. It has been around for around thirty years now but is only just beginning to scratch the surface of its true potential in the 21st century.

The desire to improve manufacturing efficiency, productivity and quality is the main 3D printing Enabled Augmented Manufacturing Market driver. Companies that are deploying it aren't just replacing machines, but redesigning the entire production line. This makes the work more efficient, fast, simple, accurate and profitable. Lead time reductions and cost savings can be enormous. The second driver of the 3D printing Enabled Augmented Manufacturing Market is the wider range of materials available for use which boosts its appeal to several industries. 3D printers have used materials like advanced nickel alloy, glass, carbon fibre, conductive ink, pharmaceuticals, electronics, and biological materials. These products can then be used in fields as diverse as aerospace & defence, medical, automotive, energy and the military.
