Abstracts

TOF sensor stands for Time of Flight sensor, also known as TOF camera or 3D camera. The principle of the TOF sensor is to measure the distance between the TOF sensor and the detected object by measuring the time it takes for the light emitted from the TOF sensor to reflect off the detected object and return to the TOF sensor. Therefore, it is not easily affected by the reflectance of the detected object. When the image captured by the TOF sensor is visualized in three dimensions, the dots in the reflected image are created from the distance data for each pixel output from the TOF sensor.

According to our (Global Info Research) latest study, the global 3D TOF Sensor Module market size was valued at US$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.

The ToF module (Time of Flight) uses the time difference of infrared light from the transmission to the reception to multiply the speed of light to obtain the distance information of the object. It has the advantages of high detection accuracy, wide detection range and simple algorithm, and can be applied to AR/VR, gesture recognition, Face ID, robots, drones and other fields. TOF module is widely regarded as the future direction of development in the industry.
