## Abstracts

According to our (Global Info Research) latest study, the global 3D Video Mapping market size was valued at US\$ 2194 million in 2025 and is forecast to a readjusted size of US\$ 6236 million by 2032 with a CAGR of 16.1% during review period.

3D video mapping is a cutting-edge visual technology that precisely 'wraps' and projects pre-produced or real-time generated dynamic video content onto the surface of irregular three-dimensional objects using computer graphics and projection technology. Its core principle is to construct a precise spatial match between a virtual digital model and the physical object. Through complex geometric correction and pixel fusion, the dynamic image perfectly fits the object's contours, corners, and textures, creating stunning naked-eye 3D visual effects on a static medium, including realistic deformation, animated narratives, and even structural deconstruction. It transcends traditional planar projection, transforming any physical surface into a dynamic narrative medium, and is a key means of realizing digital art, live entertainment, and immersive experiences.

The 3D video mapping industry has broad prospects, penetrating from large-scale cultural and tourism performances to diversified and immersive commercial applications. With the improvement of projection hardware brightness and the reduction of costs, as well as the integration of real-time rendering, interactive sensing, and AI-generated content, this technology will be more flexibly applied to areas such as urban night tours, brand pop-ups, exhibitions, virtual production, and offline entrances to the metaverse. In particular, its combination with AR technology creates a hybrid experience of 'physical space + augmented reality,' becoming a core engine for the upgrading of the cultural and tourism industry and innovation in commercial marketing.
