Abstracts

The global 4-Amino-2-Hydroxytoluene market size is expected to reach \$ 45.62 million by 2032, rising at a market growth of 4.6% CAGR during the forecast period (2026-2032).

4-Amino-2-hydroxytoluene is an organic compound with a chemical structure of C_7H_9NO . It is a derivative of p-hydroxytoluene, with a hydroxyl group on the toluene ring and an amino group. Commonly used as an intermediate in the synthesis of azo dyes. It can form dyes of different colors and characteristics by reacting with other compounds. In addition, it can also be used as a precursor for dyes and for the synthesis of pigments. In 2025, global 4-Amino-2-Hydroxytoluene production reached approximately 850 Tons, with an average global market price of around US\$ 38 per kg.

4-amino-2-hydroxytoluene is a small batch, high-purity, and relatively concentrated intermediate and fine chemical for hair dyes. The market demand mainly comes from the fields of oxidative hair dyes, cosmetic dye intermediates, custom synthesis, and laboratory reagents. The core market logic of this product is not bulk production, but rather revolves around the stability of hair dye formula, color performance, regulatory compliance, and supply chain stability. As global hair dye consumption extends from traditional whitening techniques to fashionable hair dyes, mild formulas, and multi-color products, there is still a stable demand for hair dye intermediates. However, due to the impact of cosmetic safety regulations, toxicological data, impurity control, and restricted concentration management on aromatic amine hair dye raw materials, companies are more inclined to choose suppliers with stable purity, low impurities, traceable production, and complete compliance documents.
