Abstracts

The global 4-(Methoxymethyl)aniline market size is expected to reach $ million by 2032, rising at a market growth of %CAGR during the forecast period (2026-2032).

In 2025, the global production of 4-(methoxymethyl)aniline reached 733 kg, with an average selling price of US$2,945/kg and an industry gross profit margin of 27%.

4-(Methoxymethyl)aniline, also known as p-(methoxymethyl)aniline, is an aromatic amine compound containing an aniline group and a methoxymethyl substituent on the benzene ring. It is mainly used as an organic synthesis intermediate and can serve as a building block for pharmaceuticals, agrochemicals, fine chemicals, dyes, and functional materials. Its aniline structure provides chemical reactivity, allowing it to participate in substitution, coupling, acylation, and other organic synthesis reactions.

4-(Methoxymethyl)aniline is a niche substituted aniline product rather than a bulk chemical. Its demand is mainly generated from pharmaceutical intermediates, agrochemical intermediates, research reagents and the synthesis of other aromatic amine derivatives. Since the product is usually used as a building block in downstream synthesis, the market demand is closely related to small-batch R&D, pilot-scale production and customized synthesis projects.

Downstream customers, especially pharmaceutical and research reagent users, generally have higher requirements for purity, impurity control, batch consistency and quality documentation. Products with ?98% purity are more suitable for pharmaceutical intermediate synthesis, laboratory research and process development. Therefore, suppliers with stable quality control, COA support and flexible packaging capability are more competitive in this market.

The supplier base of 4-(Methoxymethyl)aniline is mainly composed of fine chemical companies, pharmaceutical intermediate suppliers and custom synthesis service providers. These companies usually do not rely on dedicated large-scale capacity for this single product, but supply it through flexible batch production or customized production. As a result, the market is more order-driven than capacity-driven.

The production of 4-(Methoxymethyl)aniline is related to substituted aromatic intermediates, methoxymethyl functional group construction and aromatic amine formation. Therefore, the availability of upstream aromatic intermediates, methanol/methoxy-related reagents, catalysts, reducing agents and solvents can influence production cost and delivery lead time. Process stability is also important because aromatic amines usually require careful control of reaction conditions, impurity generation and environmental compliance.
