Abstracts

The global 4-Nitrobenzoic Acid market size is expected to reach \$ 146 million by 2032, rising at a market growth of 4.0% CAGR during the forecast period (2026-2032).

4-Nitrobenzoic acid is an important organic chemical raw material. It is a derivative of benzoic acid with a nitro group substituted at the para position (4-position). It usually appears as a pale yellow, odorless crystalline solid and is more acidic than benzoic acid. It is widely used in pharmaceuticals, dyes, and photosensitive materials. The upstream raw materials mainly originate from the petrochemical aromatic hydrocarbon system, with p-nitrotoluene (PNT) as the core precursor. It is produced by oxidizing the methyl group to a carboxyl group using the sodium dichromate oxidation method under a nitric acid/sulfuric acid system or the more environmentally friendly air catalytic oxidation method. Global sales in 2025 are projected to be approximately 56,000 tons, with an average market price of approximately US\$1920 per ton. The industry's gross profit margin is in the range of 15%-30%.

The downstream pharmaceutical industry, particularly the stable production of anesthetics and its applications in dyes and veterinary drugs, provides continuous market momentum. Relatively mature and continuously optimized production processes (such as the more environmentally friendly nitric acid oxidation method) provide technical support for the sustainable development of the industry. At the same time, the industry faces stringent environmental treatment costs and regulatory restrictions, making it imperative for companies to implement cleaner production process improvements.

This report studies the global 4-Nitrobenzoic Acid production, demand, key manufacturers, and key regions.
