Abstracts

According to our (Global Info Research) latest study, the global 5-Wire Resistive Touch Screen market size was valued at US\$ 5125 million in 2024 and is forecast to a readjusted size of USD 7457 million by 2031 with a CAGR of 5.6% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The structure of the five-wire touch screen is similar to the four-wire resistive type, also having a lower wire (glass or film material) conductive ITO layer and an upper wire (film material) conductive ITO layer. The working principle of the five-wire touch screen is different from that of the four-wire resistive touch screen: the driving voltages in the X and Y directions of the five-wire touch screen are generated by the ITO layer of the lower line, while the upper line layer only acts as a detection voltage probe. Even if the upper line film layer is scratched or damaged, the touch screen can still work normally, so the service life of the five-wire resistive type is much longer than that of the four-wire type.
