## Abstracts

The global 5G Automatic Inspection Robot market size is expected to reach \$ 9422 million by 2032, rising at a market growth of 8.8% CAGR during the forecast period (2026-2032).

The 5G automated inspection robot is a mobile robot system that relies on multi-source sensing hardware such as LiDAR, high-definition cameras, infrared thermal imaging, and environmental and equipment status sensors, combined with autonomous navigation and path planning algorithms, to complete routine inspection tasks with no or minimal remote intervention. It is interconnected in real time with a 5G network and cloud platform. It can automatically start, patrol, take photos/videos, measure temperature, listen to sounds, and collect gas and environmental data according to a preset plan in scenarios such as substations, petrochemical plants, factory workshops, rail transit sections, and park security. It intelligently identifies and judges the status of equipment in the local edge computing unit, and transmits the results and raw data back to the monitoring center and operation and maintenance platform via 5G with low latency. Once abnormal temperature rise, leakage, abnormal noise, or foreign object intrusion is detected, it can automatically issue alarms and generate work orders, helping enterprises migrate to a new operation and maintenance model of 'less manned, unmanned inspection.' In 2025, sales reached 145,000 units, with an average price of US\$35,000, total production capacity of 170,000 units, and a gross profit margin of 35%.

From the demand side, 5G automated inspection robots have gradually moved from 'showy demonstration projects' to 'essential tools' for frontline operations and maintenance. The common reality in industries such as power grids, petrochemicals, steel, water utilities, rail transit, ports, and data centers is that equipment scale is increasing and deployment is becoming more dispersed, but frontline inspection personnel are decreasing and experience is dwindling, while regulations are constantly

raising safety and compliance requirements?'frequent inspections, clear observations, and record keeping' have become hard indicators. Traditional manual inspections struggle to achieve 24/7, all-scenario, and fully traceable monitoring. 5G-enabled automated inspection robots fill this gap: 5G solves the problems of long-distance, high-bandwidth, and low-latency data transmission, while automated navigation and AI recognition break down the traditional 'human walking + human monitoring' work into machine actions and algorithmic decisions. Especially in unmanned substations, tank farms and pipe corridors, long-distance factory roads, and nighttime/severe weather scenarios, many owners are no longer asking 'whether to implement it,' but rather 'which locations to prioritize for pilot testing and how to integrate it with existing monitoring systems.'

From a supply and competition perspective, this sector will likely experience a period of growing pains in the short term due to 'homogenization + price wars': chassis, gimbals, cameras, and 5G modules are becoming increasingly standardized, and simply piling on hardware is no longer sufficient to create a competitive advantage. Project bidding is clearly shifting from 'comparing configurations' to 'comparing algorithms, scenario implementation, and operational capabilities.' The real growth potential lies with three types of players: First, solution providers deeply rooted in a specific vertical industry (such as power, petrochemicals, and rail transit), capable of solidifying industry standards, inspection items, and failure modes into inspection strategies and identification models, turning robots into 'industry digital employees'; second, integrators capable of connecting robots with station control systems, SCADA, AFC, security platforms, and even EAM/CMMS work order systems, creating a complete closed loop of 'inspection ? alarm ? dispatch ? review'; and third, those capable of providing services to owners through new models such as 'equipment + platform + years of service,' using leasing or charging based on the number of inspections/mileage. In the medium to long term, whoever can transform 5G automated inspection robots from one-time CAPEX equipment into a continuous OPEX maintenance service entry point will have a greater chance of maintaining high valuations and high gross margins in this round of industrial digitalization and intrinsic safety upgrades.
