Abstracts

According to our (Global Info Research) latest study, the global 5G Millimeter Wave Repeater market size was valued at US\$ 41.44 million in 2025 and is forecast to a readjusted size of US\$ 153 million by 2032 with a CAGR of 20.7% during review period.

In 2024, global 5G Millimeter Wave Repeater production reached approximately 21,041 units, with an average global market price of around US\$ 1,520 per unit.

A 5G millimeter wave repeater is a specialized device designed to enhance and extend the coverage of 5G millimeter wave signals in outdoor or indoor environments. It plays a crucial role in maintaining reliable connectivity and improving the performance of 5G networks operating in the millimeter wave frequency range (typically between 30 GHz and 300 GHz). 5G millimeter wave repeaters play a critical role in enabling reliable and high-speed connectivity for 5G networks operating in the millimeter wave frequency bands. By extending coverage, amplifying signals, mitigating interference, and maintaining compatibility with 5G standards, these repeaters contribute to the successful deployment and optimization of millimeter wave-based 5G networks.

The industry's momentum is tightly linked to the evolution of 3GPP releases and global spectrum coordination. According to the file, FR2 (24.25 GHz ? 52.6 GHz) has been confirmed as the globally harmonized mmWave band for 5G. The WRC-19 conference unlocked key bands like 26 GHz and 28 GHz, pushing regulators worldwide to finalize licensing. The maturity of R16 and R17 standards further clarifies how mmWave works in FWA, dense hotspots, and enterprise networks. This regulatory certainty boosts investment confidence for repeaters that must match these frequency allocations.

Field deployment evidence shows that mmWave is primarily positioned as a capacity booster in dense urban cores and indoor hotspots. The US remains the largest market, with AT&T, Verizon, and T-Mobile rolling out mmWave layers in major cities. The FWA model?using mmWave as last-mile broadband?is gaining traction in Europe and Asia. In these contexts, smart repeaters are vital for penetrating indoor spaces where direct macro base station coverage falls short.

Beyond traditional point-to-point relay, the evolution of Integrated Access Backhaul (IAB) under 3GPP R16 and R17 shows that repeaters can complement small cells by offering access plus wireless backhaul in one node. This unlocks new deployment flexibility where fiber is limited. Repeaters working in tandem with large-scale MIMO, beam management, and AI-driven beam tracking strengthen the value proposition for dense mmWave deployment.
