A modem is a device that converts signals between a computer and a telephone line. It consists of two parts: a modulator and a demodulator. In a 5G network, the 5G modem is a key component in the communication system. Its main task is to convert digital signals into analog signals for transmission, and to convert the received analog signals back into digital signals at the receiving end. It connects the communication link between mobile devices and base stations, supports a wider spectrum range, and achieves more efficient spectrum utilization, thereby providing users with a faster and more stable wireless connection experience.
