According to our (Global Info Research) latest study, the global 5G Plastic Antenna Raditation Units market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

The antenna vibrator is a component on the antenna, which has the function of guiding and amplifying the electromagnetic wave, so that the electromagnetic signal received by the antenna is stronger. The antenna vibrator has a rod shape, a plane shape, etc., and the processing technology includes sheet metal, PCB patch, plastic, etc. The existing two manufacturing processes are LDS process (laser direct forming technology) and selective electroplating PEP. The optional materials of 5G plastic vibrator are: PPS, LCP, PPA. The dielectric loss of LCP is lower, and the dielectric loss of PPS is almost 4‰ at 2.5GHz. The reason why the vibrator is made of LCP material is that at the actual frequency, the dielectric loss of LCP is 1.5‰, which may be lower in the case of 2.5GHz. LDS process (laser direct structuring technology) selective plating of PEP
