AAC (Augmentative and Alternative Communication) software refers to software systems specifically designed to help individuals who are unable to communicate effectively through natural language due to language, speech, cognitive, or neurological disorders. It is an important component of Augmentative and Alternative Communication (AAC) technology. This type of software typically runs on tablets, smartphones, dedicated communication devices, or computer platforms. Through features such as image symbols, text input, text-to-speech (TTS), predictive input, eye tracking, touch interaction, and AI-assisted expression, it translates user intentions into understandable information output, thereby supporting daily communication, education, social interaction, and professional activities. AAC software is widely used by individuals with autism spectrum disorder (ASD), cerebral palsy, amyotrophic lateral sclerosis (ALS), Down syndrome, post-stroke aphasia, and other language and communication disorders. With the development of artificial intelligence, natural language processing, and multimodal interaction technologies, modern AAC software is evolving towards personalization, adaptability, cloud collaboration, and intelligent prediction, continuously improving users' communication efficiency, social participation, and quality of life.
