Abstracts

The global Absorbable Microneedles market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Microneedles can be roughly divided into two categories, namely non-absorbable microneedles (traditional microneedles) and absorbable microneedles (the latest microneedles). Dissolving microneedles is to prepare biodegradable polymer materials and drugs into microneedles. After piercing the skin, the needles made of degradable materials will gradually degrade in the microenvironment, and the drugs will be released synchronously, and the drug molecules will pass through the stratum corneum barrier, absorbed into the human body through the subcutaneous tissue. Dissolvable microneedle drug delivery does not need to remove the needle body after forming micropores to deliver the drug like other microneedles, which greatly improves patient compliance. At the same time, the non-reuse of microneedles also reduces the risk of cross-infection. Therefore, 'poke and release' is also used to describe soluble microneedles.

This report studies the global Absorbable Microneedles production, demand, key manufacturers, and key regions.
