## Abstracts

According to our (Global Info Research) latest study, the global Absorber Re-circulation Pump market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The recirculation pump of the absorption tower is installed beside the absorption tower to recycle the spray liquid in the absorption tower. Single-flow and single-stage horizontal centrifugal pumps are adopted, including pump casing, impeller, shaft, guide bearing, outlet elbow, bottom plate, inlet, seal box, shaft seal, foundation frame, anchor bolt, mechanical seal and all pipes, valves, local instruments and motors. The working principle is that the centrifugal force generated by the high-speed rotation of the impeller makes the fluid obtain energy, that is, the pressure energy and kinetic energy can be improved after the fluid passes through the impeller, so that it can be transported to a high place or a distance. At the same time, negative pressure is formed at the inlet of the pump so that the fluid can be continuously sucked in. The pump head is made of corrosion-resistant material.
