## Abstracts

The global Access Router market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

The industry trend for access routers is characterized by the integration of advanced features to support growing network demands. These include higher data throughput, improved security measures, and support for new technologies like 5G and Wi-Fi 6. There is also a trend towards Software-Defined Networking (SDN) and Network Functions Virtualization (NFV), which allow for more flexible and scalable network configurations. Additionally, there is a focus on simplifying network management through user-friendly interfaces and automation tools. As networks become more complex, access routers are evolving to provide greater control, security, and ease of use for network administrators.

An access router is a type of network router that is responsible for connecting a local area network (LAN) to a wide area network (WAN), such as the internet. It serves as the gateway through which devices within the LAN communicate with devices outside the LAN. Access routers are commonly used in homes, small businesses, and branch offices. They perform functions such as IP address assignment, traffic shaping, and network security. Access routers can be standalone devices or integrated into other network hardware, like switches or firewalls.
