According to our (Global Info Research) latest study, the global Acetate Differential Agar market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Acetate differential agar is a selective culture medium used for the differentiation and enumeration of specific bacterial species based on their ability to utilize acetate as a carbon source. This agar contains sodium acetate and other nutrients that support the growth of certain bacteria while inhibiting others. The medium is designed to detect bacteria that produce specific metabolic byproducts, which may lead to a color change in the medium or the formation of distinct colonies. This differential property makes it particularly useful in microbiological studies, environmental monitoring, and food safety testing, allowing researchers to isolate and identify acetate-utilizing microorganisms efficiently.
