## Abstracts

According to our (Global Info Research) latest study, the global Acetone Cyanohydrin market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Acetone cyanohydrin is manufactured by the reaction of acetone and hydrogen cyanide in presence of water solutions such as KOH and NaOH. The intermediate product however, is unstable in alkaline solution and hence is treated with sulphuric acid until its pH reaches 1-2. Acetone cyanohydrin is used as an intermediate product for manufacturing methylacrylates, methacrylamide, methacrylic acid and methacrylonitrile among others.

The market for acetone cyanohydrin was driven by substantial demand from methylmethacrylate industry. Methylmethacrylate is further polymerized into polymethylmethacrylate (PMMA). PMMA is used in various end-user industries such as electronics & electrical, signs and displays, medical & healthcare, automotive, building & construction, waste management and water treatment industries, among others. Electronics & electrical was one of the major industries for PMMA in the past decade. Another major outlet for acetone cyanohydrins was insecticides where it is used as a raw material. Acetone cyanohydrin is used to manufacture ethyl alpha-hydroxyisobutyrate, a pharmaceutical intermediate. In addition, acetone cyanohydrins are also used in the metal separation process in the form of a complexing agent. In spite of this variety of applications, acetone cyanohydrin is usually considered as potentially hazardous chemical as it releases hydrogen cyanide when in contact with water. These environmental and health regulations associated with acetone cyanohydrins in North America and Europe can have major impact on the market and is likely to hinder the

growth of the acetone cyanohydrin market during the forecast period.
