Abstracts

According to our (Global Info Research) latest study, the global Acetonitrile for Electrolyte market size was valued at US\$ 32.67 million in 2025 and is forecast to a readjusted size of US\$ 88.02 million by 2032 with a CAGR of 15.1% during review period.

Acetonitrile for electrolyte refers to a high-purity, low organic solvent used in lithium-ion batteries and other applications. Its chemical name is acetonitrile and its molecular formula is CH_3CN . Compared with ordinary industrial grade acetonitrile, acetonitrile used in electrolytes emphasizes more on water content, acid value, metal ions, non-volatile residue, particle size, color, and batch stability control. It is usually used as the main solvent, co solvent, or additive dissolution medium. Its advantages lie in low viscosity, high dielectric constant, strong salt solubility, and good ion conductivity, which can improve the low-temperature fluidity and high rate transmission ability of electrolytes. It is suitable for the development of fast charging batteries, low-temperature batteries, high-power batteries, supercapacitor electrolytes, and new electrochemical energy storage systems. In 2025, global Acetonitrile for Electrolyte production reached approximately 6,854 MT, with an average global market price of around US\$ 4,632 per MT. The annual production capacity of acetonitrile for electrolyte is 9,000 tons, with a gross profit margin of about 30%.

The upstream mainly includes crude acetonitrile, acrylonitrile by-product acetonitrile, synthetic acetonitrile, dehydrating agent, distillation packing, molecular sieve, metal ion adsorption material, filter membrane, clean bucket, nitrogen protection packaging, hazardous chemical storage logistics, and detection equipment.

The downstream mainly targets lithium-ion battery electrolytes, supercapacitor electrolytes, etc.

Crude acetonitrile or high-purity acetonitrile raw materials account for about 45% to 60% of the total cost, distillation dehydration, adsorption impurity removal, filtration, and clean filling account for about 12% to 20%, energy, utilities, hazardous chemical safety, and environmental protection costs account for about 6% to 10%, testing, quality control, and battery customer certification account for about 5% to 10%, and packaging, warehousing, transportation, and sales management account for about 8% to 14%.

The use of acetonitrile in electrolytes is still a sub incremental direction in high-purity solvents, and its commercialization pace mainly depends on the increasing demand for high ion conductivity electrolytes in fast charging, low-temperature, high-power, and high rate energy storage systems. Traditional lithium battery electrolytes are mainly composed of carbonate solvents, with high maturity and a complete industrial chain. However, there is room for further optimization in low-temperature performance, fast charging rate, and high power output. Acetonitrile, with its low viscosity and strong salt solubility, has high application value in specific battery systems, supercapacitors, and research and development electrolytes. The future industry opportunities mainly come from high-power lithium-ion batteries, low-temperature batteries in cold regions, supercapacitors, sodium ion batteries, and interface wetting systems of semi-solid batteries. However, they are also limited by safety, volatility, electrode interface stability, regulatory transportation, long-term cycle reliability, and large customer verification cycles. The focus of competition will shift from ordinary purity to low moisture, low metal, low acid value, low residue, specialized packaging, clean filling, and battery system adaptability. Overall, acetonitrile used as an electrolyte will not completely replace mainstream carbonate solvents in the short term, but it will create differentiated application space in high rate, low temperature, supercapacitors, and new electrochemical systems. Enterprises with high-purity purification, impurity control, electronic chemical quality system, and battery customer verification capabilities are more likely to obtain long-term import opportunities.
