Abstracts

The global Acetylated Lanolin market size is expected to reach \$ 240 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

Acetylated lanolin is a type of modified lipid compound obtained by chemical acetylation reaction to partially or completely convert the active hydroxyl groups in natural lanolin into acetate groups. Compared with natural lanolin, it has better emulsification, dispersibility and thermal stability, and is widely used as an emulsifier, lubricant, cosmetic raw material and industrial additive, playing a functional role in multiple fine chemical and personal care fields. Acetylated lanolin is an excellent skincare agent that can be added as a liquid softener to human serum. It is suitable for manufacturing honey and children's products, and has good acid resistance, alkali resistance, and chemical stability. For shampoo, it has excellent foaming property. After washing, the hair is bright and easy to comb. It can also improve the solubility of essence and some oily additives. It can be used as a softener and conditioner of hair cream; In lipstick, it has formability, plasticity, dyeing uniformity and good daubing ability; For powder, it has the advantages of moisturizing the skin and adhering firmly; It is used in nail polish remover to overcome solvent degreasing. It can also be used for fatliquoring leather, which can improve its binding or coordination with collagen amino groups, hydroxyl groups, or tanning agents already bound to collagen (such as Cr complexes), and is used for processing washable leather. In 2025, global Acetylated Lanolin production reached approximately 1,036 Tons, with an average global market price of around US\$ 169 per kg.

With the continuous expansion of downstream industries such as personal care, cosmetics, high-performance lubricants, and industrial additives, the demand for acetylated lanolin as a functional modified fat in the market is steadily increasing; The

trend of environmental protection and sustainable raw materials has promoted the popularity of modified lipids from natural sources. At the same time, technical advantages such as emulsification performance, stability and formula compatibility have made them competitive in high-end skin care, lotion formula, textile auxiliaries and other fields; Although fluctuations in raw material prices and competition from alternative synthetic emulsifiers have put some pressure on the market, the overall outlook for the industry is promising, and it is expected to extend to high value-added segmented markets in the future.
