According to our (Global Info Research) latest study, the global Achondroplasia Treatment market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Achondroplasia is a disorder of bone growth that prevents the changing of cartilage (particularly in the long bones of the arms and legs) to bone. It is characterized by dwarfism, limited range of motion at the elbows, large head size (macrocephaly), small fingers, and normal intelligence. Achondroplasia (ACH) is a rare disease that causes short stature (adult height of approximately 130 cm for males and approximately 125 cm for females) with short limbs. There is no effective treatment available, and this disease is designated as an intractable disease by the Ministry of Health, Labour and Welfare. This disease results mainly from a genetic defect in FGFR3 (fibroblast growth factor type 3 receptor). This genetic change causes the receptor to be overly active to growth factors such as FGF2, which leads to reduced growth of chondrocytes, resulting a short stature. ACH occurs in a frequency of 1 in approximately 25,000 normal live births and is estimated to affect approximately 250,000 people worldwide.

The main global Achondroplasia Treatment players include Ascendis Pharma, BioMarin, Ribomic, QED Therapeutics, Pfizer, Astellas, etc. North America is the largest consumer market for Achondroplasia Treatment, accounting for about 46%, followed by Europe and China.
