The global Acid Yellow 7 market size is expected to reach \$ 12.19 million by 2032, rising at a market growth of 4.7% CAGR during the forecast period (2026-2032).

Acid Yellow 7 (Acid Yellow 7, C.I. Acid Yellow 7, CAS 2391-30-2) is a water-soluble anionic fluorescent acid dye, usually sold as a powder or laboratory reagent. Its main uses include yellow fluorescent coloring of textiles, leather, paper, and other materials, as well as fluorescent development of bloody fingerprints, footwear impressions, and contact traces in forensic evidence detection. The products gross margin is approximately 55%.

Acid Yellow 7 is a small-volume functional fine dye with a limited market size but relatively clear application boundaries. Demand mainly comes from industrial dyeing, laboratory reagents, and forensic evidence detection. Compared with ordinary yellow acid dyes, its value lies not only in coloring performance, but also in strong fluorescence response, water solubility, and compatibility with specific substrates or traces. Therefore, it is better understood as a professional functional dye rather than a bulk dye product.

Traditional textile, leather, and paper dyeing provides baseline demand, but growth potential is limited. Forensic detection, teaching experiments, and R&D reagents are more differentiated application areas. These customers usually purchase in small quantities but place greater emphasis on purity, batch stability, fluorescence effect, and ease of use. Their price sensitivity is lower than that of ordinary industrial dye users, supporting higher margins for reagent-grade products.

The Acid Yellow 7 market is expected to maintain moderate growth in the future and is

unlikely to generate significant large-scale incremental demand. Growth will mainly rely on existing dye demand, standardization of forensic laboratories, and expansion of reagent channels. Suppliers mainly include dye manufacturers, laboratory reagent brands, and forensic consumable suppliers.
