Abstracts

The global Acidic Phosphoric Acid Etchant market size is expected to reach \$ 497 million by 2032, rising at a market growth of 6.3% CAGR during the forecast period (2026-2032).

Dental phosphoric acid etchant is a dental surface treatment material with phosphoric acid as its core component. It is typically formulated as a 35% to 37% phosphoric acid gel or liquid for controlled acid etching of tooth enamel and dentin, creating a micro-roughened surface structure. This significantly improves the bonding strength in treatments such as composite resin restorations, veneers, inlays, fissure sealants, and orthodontic brackets. Thixotropic rheological design and visual coloring enhance the safety and controllability of clinical procedures. Global sales of this product are projected to reach approximately 49 million units in 2025. Based on a 3ml syringe equivalent, the average unit price in 2025 is estimated at approximately US\$6.50 per unit. A single standard production line has an annual capacity of approximately 800,000 units, encompassing processes such as solution preparation, thickening, defoaming, filling, and packaging. The upstream companies are mainly distributed in the fields of basic chemical phosphoric acid raw materials, high-purity water and fine chemical additives, and are also involved in medical consumables such as syringes, delivery heads, packaging materials and sterilization services. The midstream consists of dental material and medical device manufacturers, and the downstream covers dental hospitals and dental chain institutions, dental departments of general hospitals, orthodontic and prosthodontic clinics, denture processing institutions, dental distributors and e-commerce channels. The overall gross profit margin is about 48%. In the product cost structure, raw material costs account for about 18%, packaging and consumables account for about 28%, manufacturing and energy consumption account for about 14%, quality system and regulatory compliance account for about 10%, and sales channels and marketing account for about 30%. According to the main parameters, the products

can be classified by acid concentration into 35% type, 37% type and low concentration mild type; by form and rheological properties into thixotropic gel type, flowable gel type and liquid type; and by functional positioning into conventional total etching type, selective acid etching type and fluorine-containing or hypoallergenic formulation type. On the demand side, the downstream demand list includes resin filling and bonding restorations, veneer and inlay crown and bridge restorations, fissure sealants, orthodontic bracket bonding, and dental teaching and clinical training consumables. The downstream customer list mainly consists of large dental hospitals and chain dental institutions, dental departments of general hospitals, orthodontic specialty clinics, regional distributors and centralized procurement platforms, and dental e-commerce channels. On the business opportunity side, policy-driven factors include the downward expansion of oral healthcare services, the promotion of primary-level dental construction, and the channel concentration trend brought about by the standardized management of medical devices. Technological innovation is reflected in low-sensitivity formulas, self-limiting deep etching, rheological designs that are easier to rinse, and product combinations that synergize with universal bonding systems. Changes in consumer demands are reflected in patients' increasing demand for aesthetic restorations and their growing emphasis on comfort and low-irritation experiences, continuously driving the development of dental phosphoric acid etching agents towards high quality and high added value.

Dental phosphoric acid etching agents, as the basic consumables in adhesive repair systems, have high stability and rigidity characteristics in market demand. Their dosage directly increases synchronously with the number of oral diagnosis and treatment visits and the penetration rate of resin repair. From the perspective of development trends, traditional standardized products that mainly focus on high concentrations are evolving towards safer, easier to operate, and higher consistency. Products with low sensitivity formulas, controllable thixotropy, and highly compatible with general adhesive systems are more likely to gain clinical recognition. With the increasing proportion of oral chain and centralized procurement, product selection is shifting from a simple price orientation to a focus on brand reliability, quality stability, and compliance capabilities.

Manufacturers with large-scale manufacturing, improved quality systems, and continuous formula iteration capabilities will continue to expand their competitive advantages. The overall market for dental phosphate corrosion inhibitors is showing a mature and stable trend with structural upgrades.
