According to our (Global Info Research) latest study, the global Acoustic Emission NDT market size was valued at US$ 412 million in 2025 and is forecast to a readjusted size of US$ 664 million by 2032 with a CAGR of 7.1% during review period.

Acoustic Emission (AE) Non-Destructive Testing (NDT) is a method used to evaluate the integrity of materials and structures by detecting the transient elastic waves produced by the rapid release of energy from localized sources within the material. This technique involves placing sensors on the surface of the material to capture these acoustic emissions, which can indicate the occurrence of phenomena such as crack growth, corrosion, or plastic deformation. AE NDT is highly sensitive and can detect early stages of structural failure, providing valuable real-time information about the health of a component. It is widely used in industries such as aerospace, civil engineering, and manufacturing for monitoring the structural integrity of components like pressure vessels, pipelines, and bridges. Unlike other NDT methods, AE does not require the material to be subjected to an external force for detection, making it an efficient way to assess ongoing processes in a structure without causing any damage?.
