According to our (Global Info Research) latest study, the global Acoustic Release Transponder market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Acoustic release transponder is a device used in underwater operations to remotely release equipment or instruments from their moorings. It consists of a transducer that emits acoustic signals and a receiver that detects and interprets these signals. The transponder is typically attached to the equipment or instrument, while the receiver is connected to a control unit on the surface. When a specific acoustic signal is received, the transponder disengages, releasing the equipment or instrument from its mooring. This allows for the retrieval of the equipment or instrument without the need for direct human intervention, making it suitable for various applications, such as deep-sea exploration, oceanographic research, and underwater surveying.
