According to our (Global Info Research) latest study, the global Acousto-Optic Crystals market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Acousto-Optic Crystals are crystals that exhibit photoelastic effects, where mechanical waves stimulate elastic strains in the crystals, acting as periodic phase gratings and altering the refractive indices, leading to changes in the optical properties. One simple explanation of the fundamental working scheme is that when the mechanical oscillation field compresses the crystal material, the refractive index will subsequently increase, when the mechanical waves stretch the crystal, the result will be just the opposite. Acousto-optic crystals are used in a variety of applications that require the precise manipulation of light, such as in telecommunications, defense, medical imaging, and research. The ability to control light with sound waves makes these crystals valuable in areas where precise and rapid manipulation of light is required.
