According to our (Global Info Research) latest study, the global Acrylic Binder for Pigment Printing market size was valued at US\$ 23 million in 2024 and is forecast to a readjusted size of USD 39.7 million by 2031 with a CAGR of 8.2% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

In the textile printing process, most of the printing binder produced are acrylates, with hydroxymethyl acrylamide as cross-linked monomer, which will produce free formaldehyde harmful to human body and environment when used. In addition, this kind of adhesive printing, the fabric feel-hard, fastness, elastic elongation is small. When printing on some high-elastic fabrics, it is easy to show the bottom. If increase fastness, can increase the amount of vitrification temperature higher monomer or crosslinking agent, although can improve the color fastness, but printing fabric feel hard. Adding a proper amount of water-based polyurethane binders in acrylic system can effectively improve the above properties, especially in the occasions requiring high elasticity.
