According to our latest research, the global Active Biological Bone market size will reach USD million in 2029, growing at a CAGR of % over the analysis period.

Active biological bone is a new type of bone repair material with osteoconduction and osteoinduction, which is made by compounding bone repair material with recombinant human bone morphogenetic protein (rhBMP-2) with collagen-specific binding ability. It is mainly used to fill bone defects caused by trauma or surgery that do not affect the stability of bone structure.

The Active Biological Bone market report provides a detailed analysis of global market size, regional and country-level market size, segmentation market growth, market share, competitive Landscape, impact of domestic and global market players, value chain optimization, trade regulations, recent developments, opportunities analysis, strategic market growth analysis, product launches, area marketplace expanding, and technological innovations.

At present, the commonly used clinical materials for orthopedic repair mainly include autologous bone, allogeneic bone, traditional artificial bone and bioactive bone. Compared with traditional repair materials, active bio-bone can be combined with bone repair materials through recombinant signal molecules that can specifically bind to collagen to achieve highly directional repair, and the clinical efficacy is not inferior to autologous bone. It will become the best treatment for bone defects at present. implant material.
