Abstracts

The global Active Biological Bone market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

At present, the commonly used clinical materials for orthopedic repair mainly include autologous bone, allogeneic bone, traditional artificial bone and bioactive bone. Compared with traditional repair materials, active bio-bone can be combined with bone repair materials through recombinant signal molecules that can specifically bind to collagen to achieve highly directional repair, and the clinical efficacy is not inferior to autologous bone. It will become the best treatment for bone defects at present. implant material.

Active biological bone is a new type of bone repair material with osteoconduction and osteoinduction, which is made by compounding bone repair material with recombinant human bone morphogenetic protein (rhBMP-2) with collagen-specific binding ability. It is mainly used to fill bone defects caused by trauma or surgery that do not affect the stability of bone structure.
