Abstracts

The global Active Distributed Antenna Systems market size is expected to reach \$ 11950 million by 2032, rising at a market growth of 9.3% CAGR during the forecast period (2026-2032).

In 2025, global Active Distributed Antenna Systems production reached approximately 20,000 units, with an average global market price of around USD 310,000 per unit.

The gross profit margin of major companies in the industry was approximately 30%–52%.

In 2025, global production capacity was approximately 26,000 units.

An Active Distributed Antenna System transports radio-frequency signals over fiber or Ethernet to powered remote units that amplify and distribute cellular or private-network coverage. It supports large venues, multiple frequency bands, and multi-operator configurations. The scope excludes passive and hybrid DAS, standalone repeaters, Wi-Fi networks, macro base stations, individual antennas, small cells deployed independently, installation services, and communication-network operation.

The industrial chain includes upstream radio-frequency chips, optical modules, amplifiers, processors, cables, antennas, power supplies, enclosures, and software. Midstream covers head-end and remote-unit design, equipment manufacturing, software development, system integration, configuration, testing, and optimization. Downstream applications include airports, railway stations, stadiums, convention centers, commercial complexes, hospitals, campuses, private 5G networks, and public-safety systems.

Active Distributed Antenna Systems are indoor wireless signal coverage systems with built-in signal amplification and power supply modules, which can actively amplify and transmit signals to solve the problems of large signal attenuation and weak coverage in super-large buildings and deep indoor spaces. They are widely applicable to large transportation hubs, super shopping malls, exhibition centers and high-rise building clusters. The explosive growth of indoor 5G data traffic and the large-scale construction of super-large public buildings are the main market driving forces. Passive systems cannot meet the high-capacity and long-distance coverage demands of large scenarios, making active distributed antenna systems indispensable core equipment. In the future, the system will develop towards multi-band integration, intelligent operation and maintenance and energy saving. It can realize unified coverage of multiple operator signals, support remote real-time monitoring and fault diagnosis, reduce manual operation costs, and become the mainstream solution for large-scale high-capacity indoor wireless coverage.
