Abstracts

According to our latest research, the global Active Liquid Cooling System for Data Center market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Active Liquid Cooling System for a data center is a specialized thermal management solution designed to efficiently dissipate the heat generated by high-performance computing equipment, such as servers, CPUs, and GPUs. Unlike traditional air-based cooling methods, which rely on fans and chilled air, ALCS uses a liquid (typically water or dielectric fluids) to absorb and transfer heat away from heat-generating components directly. This allows for more effective cooling, especially in environments with high computing density. In Active Liquid Cooling System for data centers, key components typically include the Coolant Distribution Unit (CDU), Loops, and cold plates.
