An active mass damper is a device used to dampen and control structural vibrations. It uses active control technology to actively adjust the performance of the damper. It moves freely in one or more directions, is driven by a mechanical actuator, and is installed on the structure. to reduce oscillations when they exist. Active mass dampers usually consist of a mass, sensors, actuators and control systems.

Active mass dampers can adjust the damping force according to the real-time characteristics of structural vibration to achieve optimal vibration reduction effects. It has high flexibility and adaptability, allowing for more precise and effective vibration control.
