Abstracts

Noise-Cancelling Headphones is a type of high performance headphones taking Active Noise Reduction Technology to reduce unwanted ambient sounds. This is distinct from passive headphones which, if they reduce ambient sounds at all, use techniques such as soundproofing. Active Noise-Cancelling Headphones is used in the sophisticated noise-cancelling headphones that pilots use. Headphones like this have a small microphone built into their case. The microphone constantly samples the background noise and feeds it to an electronic circuit inside the headphone case. The circuit inverts (reverses) the noise and plays it into the loudspeaker that covers your ear. The idea is that the noise you would normally hear is canceled out by the inverted noise—so all that's left (and all you hear) is near-silence or the music you want to listen to.

According to our (Global Info Research) latest study, the global Active Noise-Cancelling Headphones market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The largest threat to the Active Noise-Cancelling Headphone brand of United States currently is the Original Equipment Manufacture from Asia. They may elect to manufacture their own products that are similar to original brand. It will increase the additional competition from these companies, principally located in or originating from the Asia Pacific region, which offers very low cost products, including products modeled on, direct copies of, or counterfeits products. It will lead to cause market pricing pressure, customer dissatisfaction and harm to reputation and brand name.
