Abstracts

According to our (Global Info Research) latest study, the global Active Noise Reduction (ANR) Aviation Headsets market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

In an ANR headset, a tiny microphone inside the ear cup picks up the noise around it. The noise sample is passed to electronics that produce an exact opposite “mirror image” of the sound. Tiny speakers generate the new sound back out to the ear cups. Because the generated sound is an “anti-sound” to the original noise, they meet and cancel each other out. The result is silence.

ANR only affects certain low frequencies, so normal speech, changes in engine sound and airflow over the fuselage are all easily detected. Because ANR headsets rely on electronics to block damaging noise, they don't need to clamp tightly to your head and can be lighter and smaller than other headsets.
