## Abstracts

The global Active Packaging System market size is expected to reach \$ 15935 million by 2032, rising at a market growth of 7.1% CAGR during the forecast period (2026-2032).

An active packaging system is an intelligent and functional packaging solution that actively interacts with the packaged product or its internal environment to improve preservation, safety, shelf life, and quality. Unlike traditional passive packaging, which only provides physical protection, it incorporates functional components such as oxygen scavengers, moisture regulators, antimicrobial agents, ethylene absorbers, or release-control materials to dynamically inhibit deterioration, maintain freshness, stabilize conditions, and monitor product status, making it widely applied in food, cosmetics, pharmaceuticals, electronics, and other sensitive product sectors.

The demand for active packaging systems is growing rapidly due to increasing consumer and regulatory requirements for product safety, extended shelf life, reduced food waste, and improved quality retention across industries. Rising concerns about spoilage, contamination, and sustainability, along with the expansion of global supply chains and cold-chain logistics, further drive market adoption. This trend creates significant business opportunities in the research and commercialization of biodegradable and food-safe active materials, the integration of smart sensing and indicator technologies, customized active solutions for perishable and high-value products, and the development of cost-effective scalable production processes, supporting long-term market growth and innovation in functional and sustainable packaging.
