Abstracts

Phased array radar, or Electronically Scanned Array Radar (AESA), refers to a type of radar that changes the scanning direction of the beam by changing the synthesis method of the beam emitted by the antenna surface array. Each radiator of the active phased array radar is equipped with a transmitting/receiving component, and each component can generate and receive electromagnetic waves by itself. Because its phased array surface contains a large number of active components, it is called an active phased array radar. Compared with mechanical scanning radar and passive phased array radar, active phased array radar has advantages in power consumption, resolution, reliability, etc. The main disadvantage is the high price.
