Active power filter cabinet is a power quality control device used in power systems. It is mainly used to suppress problems such as harmonics, voltage flicker and reactive power in the power system, and improve the stability and reliability of the power system. The active power filter cabinet uses advanced power electronic devices and control algorithms to monitor grid parameters in real time and respond proactively according to the requirements of the grid to offset or compensate for undesirable current or voltage in the grid by injecting opposite harmonics or reactive power.

Active power filter cabinets can achieve the following functions: harmonic compensation, power factor correction, voltage stability, and load balancing. By eliminating harmonics, improving power factor and improving voltage quality, it effectively solves power quality problems in the power system and ensures the normal operation of power equipment and the stability of the power grid.
