Abstracts

Active Vibration Isolation Unit contains a feedback circuit which consists of a sensor (for example a piezoelectric accelerometer or a geophone), a controller, and an actuator. The acceleration (vibration) signal is processed by a control circuit and amplifier. Then it feeds the electromagnetic actuator, which amplifies the signal. As a result of such a feedback system, a considerably stronger suppression of vibrations is achieved compared to ordinary damping.

According to our (Global Info Research) latest study, the global Active Vibration Isolation Unit market size was valued at US\$ 227 million in 2023 and is forecast to a readjusted size of USD 351 million by 2030 with a CAGR of 6.7% during review period.
