Abstracts

The global Active Vibration Isolator for Precision Equipment market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Active vibration isolation systems consist of feedback and feed-forward control systems with integrated sensors and actuators. These systems isolate the most sensitive equipment from the extremely low-frequency vibration that passive isolation systems amplify at resonant frequencies. The sensors detect incoming vibration in all six degrees of freedom, and a digital controller processes the measured vibration data into digital signals. The controller then sends the signals to the actuators that cancel the vibrations by generating an equal and opposite force. High-resolution electron microscopes and precision manufacturing tools require active vibration isolation systems when low-frequency vibration is problematic.

This report studies the global Active Vibration Isolator for Precision Equipment production, demand, key manufacturers, and key regions.
