Abstracts

According to our (Global Info Research) latest study, the global Actively Q-Switched Solid-State Lasers market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Q-switching technology is an effective method to obtain high-energy short pulses. The Q value is an index to evaluate the quality of the optical resonator in the laser.

The active Q-switched laser actively modulates the intracavity loss through a modulator. For example, an acousto-optic modulator is inserted in the cavity, and when RF power is applied, part of the light beam overflows the cavity through diffraction. After storing high energy in the laser medium, the RF power is suddenly turned off to form and output a laser pulse.

Actively Q-switched laser energy is continuously adjustable, while passively Q-switched laser energy is fixed.
