According to our (Global Info Research) latest study, the global Acute Intermittent Porphyria Therapeutics market size was valued at USD 50 million in 2023 and is forecast to a readjusted size of USD 56 million by 2030 with a CAGR of 1.7% during review period.

Acute intermittent porphyria (AIP), also called Swedish porphyria, pyrroloporphyria, intermittent acute porphyria) is a rare autosomal dominant metabolic disorder affecting the production of heme resulting from a deficiency of the porphobilinogen deaminase. It is the most common of the acute porphyrias.

Panhematin (hemin) is a medication used to treat acute porphyria, a rare genetic disorder that affects heme production. Its effectiveness in managing acute porphyria attacks and reducing symptoms has driven market growth. The rarity of the condition and limited treatment options contribute to its niche status. However, challenges include the need for careful monitoring and potential side effects. The market competition is relatively small, as Panhematin remains a specialized therapy.
