Abstracts

Acute lymphoblastic leukemia (ALL) is a cancer of white blood cells called as lymphocytes in bone marrow. It is a malignant disease in which early precursor lymphoid cells proliferate and replace the normal hematopoietic cells of bone marrow. ALL is the most common type of cancer in children. There is overproduction of lymphoblasts in the bone marrow when a person suffers from ALL that continuously multiply, damaging the bone marrow by preventing the production of normal cells such as red blood cells (RBC) and platelets. Increase in number of lymphoblast in the blood results in the decline of healthy RBCs, white blood cells, and platelets. This leads to anemia, bleeding, and infection. The cancer can spread to the spinal cord and the brain.
