Abstracts

The global Acyl Fluoride market size is expected to reach \$ 1839 million by 2032, rising at a market growth of 5.8% CAGR during the forecast period (2026-2032).

Acyl fluoride refers to a class of highly reactive organic compounds with the general structure R-COF, where a carbonyl group is directly bonded to a fluorine atom. They are typically produced through fluorination of corresponding acyl chlorides (using fluorinating agents such as HF or specialized reagents), direct carbonylation-fluorination routes, or via conversion from carboxylic acids using deoxyfluorination chemistry. In the supply chain, upstream inputs include petrochemical or bio-based feedstocks (for carboxylic acids), fluorine sources (e.g., hydrogen fluoride, fluorinating reagents), and catalysts; midstream processing involves controlled synthesis, purification, and stabilization due to the compound's high reactivity and moisture sensitivity; downstream, acyl fluorides are primarily used as intermediates in pharmaceuticals, agrochemicals, specialty polymers (e.g., fluoropolymers), and fine chemicals, where their selective reactivity offers advantages over acyl chlorides in precision synthesis. The market is characterized by specialized chemical manufacturers with strong fluorine chemistry capabilities, strict handling requirements, and integration with high-value downstream applications. In 2025, global Acyl Fluoride output was about 700,000 tons with 1.0 million tons of capacity, average prices of USD 1,500–3,000 per ton, and gross margins around 24%.

This report studies the global Acyl Fluoride production, demand, key manufacturers, and key regions.
