According to our (Global Info Research) latest study, the global Adaptive Cable Equaliser market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

An adaptive cable equaliser is a digital circuit that compensates for a digital signal's in-channel complex frequency response impairments. The cable industry has long used the term frequency response to describe amplitude (or magnitude)-versus-frequency—that is, what is seen on the display of test equipment used to sweep outside plant. True frequency response is a complex entity that has two components: amplitude-versus-frequency, and phase-versus-frequency. An adaptive equalizer can compensate for in-channel amplitude- and phase-versus-frequency impairments.
