Abstracts

According to our (Global Info Research) latest study, the global ADAS Hardware-in-the-Loop (ADAS HiL) Test market size was valued at US\$ 525 million in 2025 and is forecast to a readjusted size of US\$ 834 million by 2032 with a CAGR of 6.9% during review period.

ADAS hardware-in-the-loop testing refers to a method of real-time simulation testing of advanced driver assistance systems at the hardware level. In ADAS HiL testing, real ADAS hardware (such as sensors, control units, etc.) is integrated into a simulation environment to test and verify the vehicle's driving behavior through virtual scenarios. In this testing method, sensors (such as cameras, radars, lidars, etc.) receive inputs from the virtual environment through simulators, and the electronic control unit (ECU) makes decisions based on these inputs. The entire process enables developers to simulate real-world driving situations in the laboratory and test the system's response, decision-making, and performance under different driving conditions without the need for real vehicles to drive on the road. The advantage of ADAS HiL testing is that it can detect and correct system problems in the early stages of development, thereby saving development time and cost, while ensuring that the system can respond correctly in a wide range of scenarios, enhancing its reliability and safety.
