Addressable Manual Alarm Call Points (AMACPs) are devices used in fire detection and alarm systems that allow individuals to manually trigger an alarm in case of fire or emergency. Unlike conventional systems, addressable call points are part of a more advanced, networked system where each device has a unique 'address' or identifier. This allows the control panel to pinpoint the exact location of the triggered alarm, improving response times and system management. When the call point is activated, typically by breaking a glass or pressing a button, it sends a signal to the central control panel, which can then initiate necessary actions, such as sounding alarms or alerting authorities. These systems are commonly used in large or complex buildings, where precise identification of the alarm source is crucial for safety and efficiency.
