According to our (Global Info Research) latest study, the global Adhesive for New Energy Vehicle Batteries market size was valued at US\$ 1263 million in 2024 and is forecast to a readjusted size of USD 4379 million by 2031 with a CAGR of 19.2% during review period.

Adhesives for new energy vehicle batteries refer to high-performance adhesive materials specifically used in battery components for electric vehicles (EVs) and plug-in hybrid electric vehicles (PHEVs). These adhesives are mainly used to fix battery cells, connect battery modules, seal battery packs, and enhance the stability of the overall structure. They must have excellent heat resistance, chemical corrosion resistance, mechanical strength, and electrical insulation properties to ensure safety and reliability under extreme working conditions. In addition, in order to adapt to automated production and environmental protection requirements, these adhesives must also have the characteristics of fast curing, low volatile organic compound (VOC) emissions, and easy application.

In the future, the development trend of adhesives for new energy vehicle batteries will pay more attention to improving material performance and environmental friendliness, and promote technological innovation to meet the ever-increasing safety and efficiency standards. On the one hand, with the increase in battery energy density and the advancement of fast charging technology, the development of new adhesives with higher thermal conductivity, flame retardancy and anti-aging ability has become a key direction. These materials can effectively dissipate heat and prevent thermal runaway, thereby improving the safety and service life of the battery. On the other hand, increasingly stringent environmental regulations have prompted the industry to turn to

recyclable and bio-based materials to reduce the impact on the environment. At the same time, in order to support efficient large-scale production, the design of adhesives will also pay more attention to the needs of compatible automated production lines, such as the development of self-healing or intelligent responsive adhesives, which can not only simplify the manufacturing process, but also further improve the reliability and durability of the product. These advances not only enhance the overall performance of the battery, but also provide important guarantees for the sustainable development of the new energy vehicle industry.
